

Have your Say about the Bay.

Deadline for comments is: Friday, May 5, 2017

Do you think these environmental challenges are ready to be removed from the impaired list?

Degradation of fish and wildlife populations

The Bay, now, has a balance of prey and predator species due to fisheries management, improved habitat, and reduced phosphorus levels

Degradation of benthos

Underwater bugs tell us about water quality. Bugs requiring good water quality are present in the Bay.

Loss of fish and wildlife habitat

Underwater plants provide habitat for smaller prey fish like perch and sunfish and hunting grounds for top predators like walleye, bass and pike
